HOOK

Every year, **2 to 5 percent of global GDP** — up to two trillion dollars — is laundered. And only about **1 percent** is ever caught.

Why? Because the people moving that money never put their own name on the payment. They hide behind shell companies, stand-ins, and chains of accounts. A bank checks the name against a sanctions list, sees nothing, and lets it through.

0:30
WHAT IT IS

We're **ctrl alt elite**, and we built **ScreenSmart** — real-time sanctions screening that doesn't just check the name, it **follows the money**. Every payment gets a **MATCH, REVIEW, or NO-MATCH** verdict in under a second, streamed live to an analyst dashboard.

1:00
HOW IT
WORKS

Two engines screen every payment in parallel. The first is **name & identity** — a machine-learning model that catches typos, transliterations and aliases; "Qadhafi" spelled five different ways.

The second is the **network engine**: it traces the account through a graph of counterparties to find hidden links — payee, to an intermediary, to a **sanctioned entity two hops away**. The results are combined, worst-case wins, and the payment is flagged with a full evidence chain.

And because an analyst shouldn't need a data-science degree, a **local AI model — running entirely on-device** — explains, in plain English, exactly why each payment was flagged.

DEMO

→ *switch to the live dashboard*

1. "Every dot is a real payment being screened right now — **green** cleared, **amber** review, **red** blocked."
2. Click a flagged one → "here's the **network graph**: this account routes through a middle account to a sanctioned source."
3. Hit **Explain** → "the on-device AI walks me through it in plain language."
4. Click **Block** → "that account becomes a known-bad node, so the next payment through it is caught automatically. **The system learns.**"

2:30
CLOSE

Sanctions screening today catches the obvious and misses the clever. ScreenSmart **catches the network**, **explains the decision**, and gets smarter every time an analyst acts.

Real-time, on-device, and built in a weekend. That's **ScreenSmart**. Thank you.
